PREFACE

(U) The purpose of this report is to examine the Chinese aviation industry design and development process and resources. It focuses on those facilities which were a part of the former Ministry of Aeronautics Industry. In March 1988, the Chinese military product industry underwent a massive reorganization. The former Ministry of Aeronautics Industry was merged with the former Ministry of Astronautics Industry to become the Ministry of Aero Space Industry. The new organization is now responsible for aircraft, space, and missile weapons programs.

(U) This document was prepared in response to DIA Task PT-1830-01-04L "Technological Base Management—China."

(U) Comments are invited and should be forwarded to the Defense Intelligence Agency (ATTN: DIA/DT-5A), Washington, D.C. 20340-6053.

CHINESE AVIATION WEAPONS DEVELOPMENT PROCESS (U)

Fig. 4-(U) Chinese Military Product R&D Structure

1. Development Process (U)

(U) ~~(S)~~ China's weapons development process involves six phases (Figure 5):

- Theoretical Evaluation (U)
- Program Phase (U)
- Engineering Development (U)
- Design Finalization (U)
- Production Finalization (U)
- Government Approval (U)

1.b. Program Phase (U)

1.b.(1) Request for Proposals and Contractor Selection (U)

(U) This is a very new phase in the Chinese weapons acquisition cycle, and it is not well developed nor understood yet by the Chinese. Prior to this time, COSTIND selected the contractor for a weapon system; now this is being done by the PLAAF.

(U) As major policy decisions in China are the responsibility of the Communist Party leadership, decisions are formalized by decrees and orders, and policy is implemented and administered through and by the State Council. The State Council is, by design, the instrument that translates Party policy decisions into formal, official orders and directives and then administers the execution of work. At this level, the question of which official or ad hoc entity makes the basic policy decisions is largely academic, for, at any given time since the late 1950's, the membership of these groups (and also the Standing Committee of the State Council) has been significantly interlocked. The State Council "signs off" on all of the major policy decisions regarding weapons programs, though that organization probably has a minimum role in the policy-making process.

(U) A number of State agencies have certain responsibilities in weapons program activities. The State Planning Commission (SPC) is involved with military product R&D. It levies requirements for the development of civilian-sector science plans; reviews, revises, and approves these plans; aggregates them into an overall science plan; integrates that plan with general economic planning (e.g., a Five-Year Plan); and allocates funds through the Ministry of Finance. The SPC also integrates defense R&D and industrial plans and budgets into the overall economic plan through its National Defense Bureau.

7. Aeronautical Institute, Nanjing (U)

~~(S, NF, WH)~~

(U) Coordinates: 32°02' N/118°49' E

(U) The Nanjing Aeronautical Institute (NAI), formed in 1956, is located in the southern section of Nanjing. It is a technical university whose major strength is in aeronautical engineering, but it also offers courses in the physical science, management science, social science, and human science. The institute has approximately 100 teaching staff and 3,000 full-time students. The NAI is one of several institutes conducting research and development of helicopters, and is responsible for the first Chinese-designed helicopter.

(U) The Institute (Figure 26) has more than 20 special research organizations including the remote-pilot airplane research office and the aerodynamics research office. No rotating test stands are used at NAI; only static test stands are used. It has 38 laboratories that can be used for teaching and research, a large computing center, a test and measurement center, an electronic education center, and a computer-aided-design center. NAI also has a library hall with over 10,000 m² of building space and more than 700,000 books.

(U) The purpose of the variable turbulence wind tunnel is to generate controlled turbulent flow. One area the tunnel is designed to study is the effect of turbulent flow on the development of the adherent surface layer of various geometric shapes. Surfaces experimented with in the past include flat plates and cylindrical bodies.

(U) The variable turbulence wind tunnel has test section dimensions of 1.2 x 0.3 x 6 m. Tunnel airflow velocity ranges from 8 to 42 m/s. A choice of seven variable-turbulence grid screens is used to change the degree of turbulence and structure of the air current in the test section. Slots upstream of the test section remove the boundary layer from the flow profile. The resulting turbulent flow is further controlled by an adjustable plate which is used to regulate the stationary pressure gradient in the axial direction. The variable turbulence wind tunnel appears to be used only for basic research.

(U) The supersonic blowdown wind tunnel is used primarily for engine inlet testing. The engine inlet model is located downstream of the variable pitch supersonic nozzle. The nozzle has flexible walls to vary airflow Mach number seen by the engine inlet.
